## **DEFINITION**

Anemia, one of the more common blood disorders, occurs when the level of healthy red blood cells (RBCs) in the body becomes too low. This can lead to health problems because RBCs contain hemoglobin, which carries oxygen to the body's tissues. anemia can cause a variety of complications, including fatigue and stress on bodily organs.

Anemia can be caused by many things, but the three main bodily mechanisms that produce it are:  
excessive destruction of RBCs  
blood loss  
inadequate production of RBCs

Among many other causes, anemia can result from inherited disorders, nutritional problems (such as an iron or vitamin deficiency), infections, some kinds of cancer, or exposure to a drug or toxin.

## **GENERAL SYMPTOMS OF THE DISEASES:**

If your child has anemia, the first symptoms might be mild skin paleness, and decreased pinkness of the lips and nailbeds. These changes happen gradually, though, so they may be difficult to notice. Other common signs of anemia include:

- irritability
- fatigue
- dizziness, lightheadedness, and a rapid heartbeat

## **DIAGNOSING ANEMIA**

In many cases, doctors don't diagnose anemia until they run blood tests as part of a routine physical examination. A complete blood count (CBC) may indicate that there are fewer red blood cells than normal. Other diagnostic tests may include:

## **BLOOD SMEAR EXAMINATION:**

Blood is smeared on a glass slide for microscopic examination of RBCs, which can sometimes indicate the cause of the anemia.

## **IRON TESTS:**

These include total serum iron and ferritin tests, which can help to determine whether anemia is due to iron deficiency.

**HEMOGLOBIN ELECTROPHORESIS:** Used to identify various abnormal hemoglobins in the blood and to diagnose sickle cell anemia, the thalassemias, and other inherited forms of anemia.

**BONE MARROW ASPIRATION AND BIOPSY:**

This test can help determine whether cell production is happening normally in the bone marrow. Its the only way to diagnose aplastic anemia definitively and is also used if a disease affecting the bone marrow (such as leukemia) is a suspected cause of the anemia.

**RETICULOCYTE COUNT:**

A measure of young RBCs, this helps to determine if production of red blood cells is at normal levels.

**RECOMMENDED DURATION OF THE COURSE**
