

An ERP package for Spinning Mill, the objective of our computer-based software is to monitor as well as control day-to-day process and document flow within organization. In this, process software would identify:

- All major & minor cost centers
- Workout cost figures
- Generate information to the higher management

These steps would ensure that cost parameters are optimized. This system would also consider material and human resource available at client's end and help in optimizing its usage.

We hold expertise in developing separate systems for each location including factories & offices. At each of these two locations, the information flow would be based on separate local area network and local central database. Further, provision can also be made to use web server space as a sink to transfer data between systems.

This software can be designed to cover following areas:

- Process Control
- Bale Management System
- Packed & Dispatch
- Bio Cotton Management
- Purchase Management
- Procurement of Raw Material
- Acceptance of Client Order and Distribution of Finished Product
- Store Management
- Bank Formalities, Pre and Post export documentation
- Financial Management
- Payroll and Personnel Management
- Vehicle Management
- Waste Management
