

MOZZZART™

DESTROYS MASSES OF MOSQUITO POPULATION IN A REGION

Effective over ¼ - ½ acre area. Designed for outdoor environment.

Reduces the risk of serious diseases like malaria, dengue and chikun gunya

Mosquitoes are carriers and spreaders of some of the most dangerous epidemic diseases like malaria, dengue and chikun gunya.

Conventional methods of mosquito control have been proven to be ineffective or expensive or harmful to the human beings as well as to the environment.

- Diesel spray: Displaces the mosquitoes only temporarily. Mosquitoes return to the area within hours. Dangerous to environment.
- DDT sprays: Dangerous to human beings.
- Chemical aerosol sprays: Very limited area and very high cost.
- Electronic charged rackets: Very limited effectivity. Requires regular human efforts.
- Domestic chemical systems (coils, liquids, mats etc.): Very limited coverage area and poor results in overall mosquito population control. Prolonged exposure causes allergic reactions such as cough, skin irritation, dandruff etc.

MOZZZART™ from Dolphin Floats Pvt. Ltd. is a revolutionary method because it works on “attracting masses of mosquitoes in a trapping zone”. These can then be killed by leaving them there for 8-10 hours or by very nominal use of chemical sprays.

MOZZZART™ offers the following advantages:

- Specifically targets the female mosquitoes which lay an average of 30-300 eggs in their lifespan! (Only female mosquitoes attack humans because they need human blood as a source of protein for laying eggs.)
- TRAPS & KILLS MASSES OF MOSQUITOES instead of just displacing them temporarily or killing them in small numbers with high chemical usage.
- Catch rate ranges up to 30 - 600 mosquitoes per night depending on level of infestation.
- Causes major destruction of mosquito population in an infested area within 2-3 weeks by upsetting breeding cycle of mosquitoes in the entire region.
- Does not use dangerous chemicals / excesses thereby reduces risk to human beings as well as environment.
- Offers extremely high effectivity rate as compared to any of the conventional systems being used.
- Mimics human body by controlled release of carbon dioxide (CO₂) and electronic profiling.
